

AGENDA HEPTROMIC MEETING

9th October 3pm-6pm (CET)

15:00-15:45 Methylation study (IDIBELL team and Broad): final results. Methylation-based classification, prognosis prediction and selection of final candidates for validation by bisulfite sequencing (Diagenode).

15:45-16:30. HCC sequencing (INSERM team): preliminary results from our 50 poor-prognosis HCC. Evaluate integration strategies with other sequencing efforts.

16:30-17:00. Integrative genomic analysis of HCC (all): including mRNA, miRNA, methylation. Evaluate performing additional characterization including DNA copy number changes. As you know, this initiative is unprecedented in HCC and may have a strong impact.

17:00-17:45 Animal models (Tuebingen team): Lars' team has already generated nice preliminary data on some of the initial candidates that we proposed.

17:45-18:00. Wrap-up and Q&A
